

Stormwater drainage

How stormwater is managed
within the levee bank network

Stormwater drainage

Normal drainage when it rains

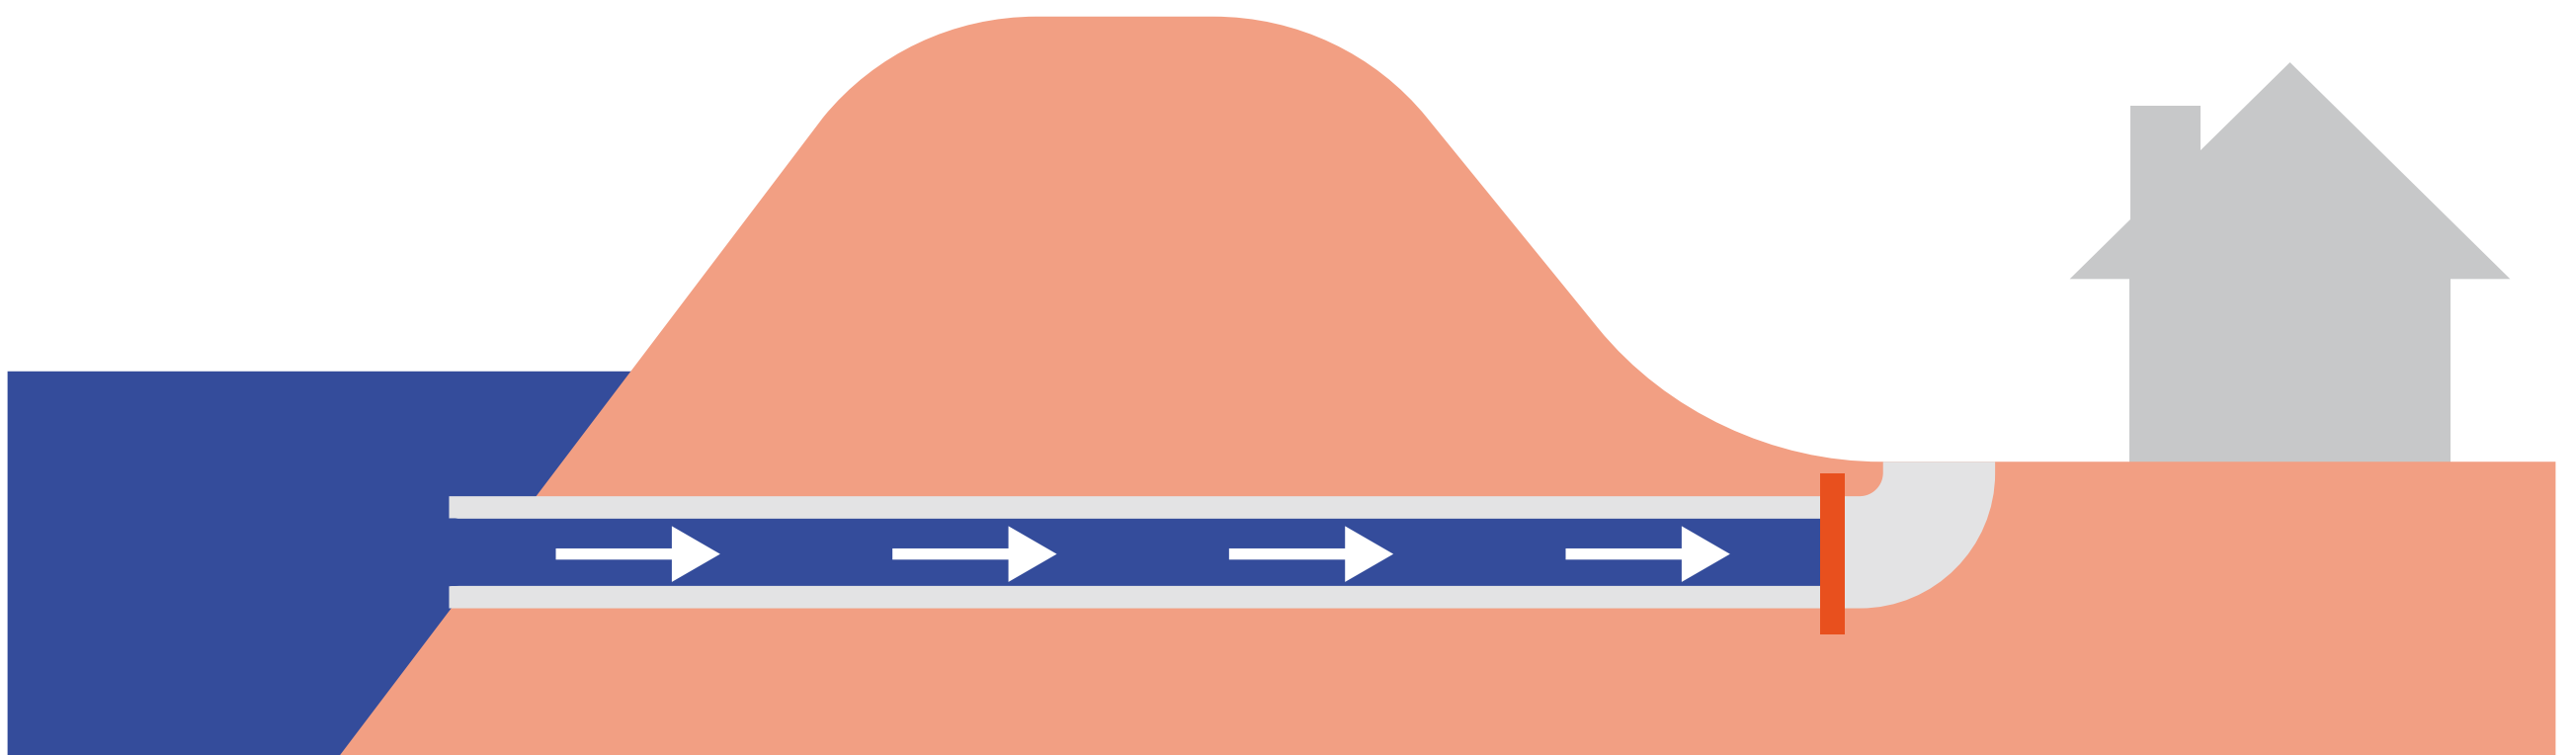

Stormwater drains out through stormwater pipes and into the River.

Stormwater drainage

During floods

When the River level rises over a stormwater pipe, water can come back in through the pipe and cause flooding. Stormwater pipes therefore must be blocked to prevent backflow.

Stormwater drainage

During floods when it rains

Water cannot go out through the stormwater pipes that have been blocked. Pumps are installed across the stormwater network to remove the stormwater and pump it over the levee and back into the River.
